Descriptors for Crop Wild Relatives conserved <i>in situ</i>	1

FOREWORD

One of the main factors adversely affecting the conservation, use, monitoring and reporting of information on Plant Genetic Resources for Food and Agriculture (PGRFA) is the lack of access to data and inefficient exchange of information. This is, in large part, due to the different approaches to data management and documentation, which have prevented the creation of a unique language to share data despite the many attempts, so far, to do so.

This lack of standardization had prevented the PGRFA community from exchanging PGRFA data worldwide and had, for years, been one of the main challenges for the effective conservation and sustainable use of plant material. These gaps represent a barrier to the sharing of information in the scientific community and to the development of value-added services for plant breeders, researchers and organizations working on agricultural biodiversity. If crop wild relatives (CWR) *in situ* resources are to be conserved and sustainably used, it is fundamental to bring their information into an accessible standardized format to secure a consistent data compilation and management.

To meet these challenges, the Secretariat of the FAO International Treaty on Plant Genetic Resources for Food and Agriculture (ITPGRFA) undertook to address the gaps and the lack of coherence in the documentation methods for plant resources, in particular for Crop Wild Relatives (CWR) conserved under *in situ* conditions, through the development of an international standard. It has developed an international language for CWR *in situ* data that will enable countries to compile and exchange data held by different national and international organizations, advanced research institutes and other bodies. Compilation and data exchange for on-farm managed cultivated PGRFA is not addressed in this document.

This technical paper is an additional tool by which the Secretariat seeks to strengthen capacities of Contracting Parties and National Programmes on the implementation of the International Treaty. The List of Descriptors will help users to understand how CWR *in situ* information can be documented and integrated in their institutional workflow, including what data need to be provided and how to do it.

The accomplishment of this undertaking was possible thanks to the work of experts, technical staff and national focal points of the Treaty involved in the consultations and related discussions over this year. Special thanks to the support of the members of the Core Advisory Group who provided scientific guidance to the development process of this List of Descriptors. The financial support provided by the Government of Germany,

which made it possible for us to undertake this project is acknowledged and highly appreciated.

We hope that this material meets the needs of researchers and users of CWR material and the broader plant genetic resources community, and that it will also contribute to the way plant genetic resources for food and agriculture are documented and exchanged at the global level.

A handwritten signature in black ink, consisting of stylized, overlapping loops and lines, positioned above the printed name and title.

Kent Nnadozie
Secretary

**International Treaty on Plant Genetic Resources
for Food and Agriculture (ITPGRFA)**

ACKNOWLEDGEMENTS

This technical paper has been developed and published thanks to the project “*Development of a globally agreed list of descriptors for in situ Crop Wild Relatives Documentation*”, funded by the Federal Ministry of Food and Agriculture of Germany.

The Secretariat of the International Treaty of FAO acknowledges all the institutions and individuals who have contributed to the accomplishment of this work.

Our very special thanks go to the experts who participated in the various consultations, round tables and training workshops for their valuable inputs and suggestions.

This publication also benefited from the valuable review by members of the Core Advisory Group of the project, specially selected for the validation of the survey results whose names are listed under the *List of Contributors* below. They are acknowledged for their significant support, guidance and advice.

Finally, we thank all the national focal points of the International Treaty and individuals who provided important inputs in the consultation process and for the improvement of this publication.

We are grateful to the colleagues of the Treaty Secretariat and other technical staff of FAO for their contribution to the development of this document. Thanks to Adriana Alercia, Francisco López, Marco Marsella, Ana Laura Cerutti and Gerardo Francione for their direct inputs and active coordination of the project.

Kent Nnadozie, Secretary of the International Treaty, held the overall responsibility for this publication.

DESCRIPTORS FOR CROP WILD RELATIVES CONSERVED *IN SITU* (CWRI v.1)

18 December 2020

This list of passport Descriptors for Crop Wild Relatives conserved *in situ* (CWRI v.1) has been developed taking the *Core Descriptors for in situ conservation of CWR* v.1¹ published by Bioversity International in 2013 as the starting point. It also builds on recent experiences conducted by the Secretariat of FAO's International Treaty on Plant Genetic Resources for Food and Agriculture (ITPGRFA) in the context of the development of its Global Information System (GLIS), as well as on the inputs of international projects such as the Farmer's Pride.

The CWRI passport descriptors proposed here constitute the minimum initial list for CWR *in situ* data exchange. They are the result of consultations conducted with the support of the national focal points of the International Treaty and selected international partners and experts, as reported in the 'Contributors' section. A global survey was conducted in early 2020 and the inputs of more than 107 experts from 87 institutions in 48 countries have been analysed and taken into consideration. We are also thankful to all the scientists that have served in the Core Advisory Group (12 members) for their valuable support in setting the direction of the research and taking a prominent role in the validation of the results.

The list is intended to be a user-friendly data exchange tool for which data should be available worldwide. Its wide adoption and use will facilitate and streamline the collection of data needed for documenting *in situ* CWR in a consistent way.

For each descriptor, this tool provides a brief explanation of content, its coding scheme, and a suggested field name. Nevertheless, on-farm management of plant material is not addressed in this document. It is to be noted that suggested mandatory descriptors are highlighted.

The standard descriptor list for CWR *in situ* documentation developed and validated at the global level through this project is an evolving document. The future modification or addition of further descriptors should not be precluded when more data would become available. These CWRI descriptors are designed to facilitate the compilation and exchange of CWR *in situ* passport data. They are also designed to contribute to the further development of the Global Information System (GLIS) and support the conservation and utilization of CWR throughout the world. Furthermore, they aim to be compatible with the 'Digital Object Identifiers for food crops - Descriptors and guidelines of the Global Information System' (Alercia *et al.* 2018).

¹ *Core descriptors for in situ conservation of crop wild relatives v.1.*

The Secretariat of the International Treaty welcomes any suggestions for the improvement on this first version (v.1) of Descriptors for *in situ* conservation of CWR and can be sent to the Secretary of the International Treaty pgrrfa-Treaty@fao.org.

MANDATORY DESCRIPTORS

1. **Genus**
2. **Species**
6. **Country of occurrence**
13. **Observation date**
14. **Population identifier**
18. **Managing institute, legal entity or individual name**

** Descriptors numbers belonging to the list published in 2013 are included in parentheses (x.x.x) next to the descriptor's name.*

1. **Genus** (1.1.1) (GENUS)

Genus name for taxon.

2. **Species** (1.1.2) (SPECIES)

Specific epithet portion of the scientific name. If unknown, 'sp.' is allowed.

3. **Species authority** (1.1.3) (SPAUTHOR)

Provide the authority for the species name. It is recommended to use the Catalogue of life.

4. **Subtaxon** (1.1.4) (SUBTAXA)

Subtaxon can be used to store any additional infraspecific epithet. The following abbreviations are allowed: 'subsp.' (for subspecies); 'var.' (for botanical variety); 'f.' (for form). It is recommended to use the Catalogue of life.

5. **Subtaxon authority** (1.1.5) (SUBTAXA)

Subtaxon authority at the most detailed taxonomic level.

6. Country of occurrence (2.1.1) (ORIGCTY)

Country where the CWR population was observed or inventoried. Use the Three-letter ISO 3166-1 code of the country where the site is located.

7. Location of occurrence site (2.1.2) (OCCURSITE)

Location information below the country level that describes the site where the population sample was observed, inventoried, or collected, preferably in English. This might include the distance in km and direction from the nearest town, village, or map grid reference point, (e.g. 7 km south of Curitiba in the state of Parana).

7.1 Name of the location or nearest place

Name of the site location or nearest place to site (village, town, city or landmark). The name used may also be created to indicate a place that may not have proper names (e.g. the junction of two named roads).

7.2 Distance to site [km]

Distance in km from nearest named place to site.

7.2.1 Type of distance

- 1 Road distance
- 2 Straight distance

7.3 Direction from nearest named place

Direction of site from nearest named place in degrees relative to North.

8. Latitude of occurrence site (Decimal degrees) (2.1.3.1) (DECLATITUDE)

Latitude of the site expressed in decimal degrees. Positive values are North of the Equator; negative values are South of the Equator (e.g. -44.6975).

9. Longitude of occurrence site (Decimal degrees) (2.1.3.2) (DECLONGITUDE)

Longitude of the site expressed in decimal degrees. Positive values are East of Greenwich Meridian; negative values are West of the Greenwich Meridian (e.g. -120.9123).

10. Coordinate datum (2.1.3.4) (COORDDATUM)

The geodetic datum or spatial reference system in which the coordinates given in decimal latitude and decimal longitude are based (e.g. WGS84, ETRS89, NAD83).

11. Elevation of site [masl] (2.1.4) (ELEVATION)

Elevation of site expressed in meters above sea level. Negative values are allowed.

12. Site protection (2.4) (SITEPROT)

Indicate whether the site is under any legal or official legislation. Follow IUCN Guidelines available at <https://portals.iucn.org/library/node/30018>

13. **Observation date** [YYYY-MM-DD] (3.1.1) (OBSDATE)

The most recent date the population was observed.

14. **Population identifier** (3.1.2) (POPID)

The identifier (sequential number or code) that you use to identify your population. Each distinct population should be given a population unique identifier.

15. **Collecting number** (3.2.3) (COLLNUMB)

Original identifier assigned by the collector(s) to the sample/specimen deposited in the genebank.

16. **Status of occurrence site** (3.2.4) (POPSRC)

Status of the occurrence site of the population.

10 **Wild** (11 Forest or woodland, 12 Shrubland, 13 Grassland, 14 Desert or tundra, 15 Aquatic habitat)

20 **Farm or cultivated area** (21 Field, 22 Orchard, 23 Backyard, kitchen or home garden, 24 Fallow land, 25 Pasture, 28 Park)

60 **Weedy, disturbed or ruderal habitat** (61 Roadside, 62 Field margin)

99 **Other** (for example coastal habitats, elaborate in REMARKS field)

17. **Biological status of the population** (SAMPSTAT)

The coding scheme proposed can be used at different levels of detail, either by using the general codes (in **boldface**), such as 100 or 200, or by using the more specific codes such as 110, 120 or 130.

100 **Wild**
110 Natural
120 Semi-natural/wild
130 Semi-natural/sown

200 **Weedy**

999 **Other** (elaborate in REMARKS field)

18. **Managing institute, legal entity or individual name** (MNGINSTNAME)

Name and address of the institute, legal entity, herbarium, or individual responsible of the population (e.g. protected area authority, nature reserve manager, national park manager, private landowner, etc.).

18.1 **Managing institute or individual address** (MNGINSTADDRESS)

19. **Name of the institute or individual holding *ex situ* samples** (INSTNAME)
Name and address or code of the institute, legal entity, herbarium, or individual where collected population samples are deposited (e.g. local or national genebank, or herbarium). If the Managing institute has collected material, the holding institute name and address should be the same as the Managing institute.

19.1 **Address of the holding organization or individual** (INSTADDRESS)

20. **Code of the institute or herbarium holding *ex situ* samples** (3.2.5.2)
FAO WIEWS institute code or Index Herbariorum code of the institute where the *ex situ* accession/specimen is maintained.

20.1 **FAO WIEWS institute code** (<http://www.fao.org/wiews>) (INSTCODE)

20.2 **Index Herbariorum code** (<http://sweetgum.nybg.org/science/ih/>) (HERBCODE)

21. **Accession/specimen number** (3.2.5.1)
This is the unique identifier for accessions or specimens collected (e.g. genebank, herbarium, etc.) and is assigned when a sample/specimen is entered into the collection.

21.1 ***Ex situ* accession number** (ACCENUMB)

21.2 **Herbarium specimen number** (SPECNUMB)

22. **Conservation actions in place** (3.5) (CONSACTION)
Indication whether conservation actions related to the population are in place. Use the IUCN classification scheme for conservation actions in place (available from https://nc.iucnredlist.org/redlist/content/attachment_files/dec_2012_guidance_conservation_actions_in_place_classification_scheme.pdf) (adapted).

- 0 No conservation actions
- 1 Monitoring and Planning
- 2 Land/Water Protection and Management
- 3 Species Management
- 4 Education and Legislation
- 99 Other (elaborate in REMARKS field)

23. **MLS status of the material**

(MLSSTAT)

The status of the *ex situ* accession of the CWR population with regards to the Multilateral System of Access and Benefit-sharing of the International Treaty, if available.

0 Not available under the MLS

1 Available under the MLS

24. **Links to associated information** (URL)

(LINKS)

One or more URLs where further information about the CWR can be found. Multiple values are separated by a semicolon without space.

25. **Remarks**

(REMARKS)

The Remarks field is used to add notes or to elaborate on descriptors with value 99 or 999 (= Other). Prefix remarks with the field name they refer to and a colon (:) without space (e.g. SITESTAT:riverside). Distinct remarks referring to different fields are separated by semicolons without space.

OPEN QUESTION

Global Unique Identifier

Various experts indicated that the use of a global unique and persistent identifier (PUID) would be useful to build automatic services to integrate CWR *in situ* data and to enable the desired linkages between populations and other genotype entities across different information systems.

The Secretariat of the International Treaty on Plant Genetic Resources for Food and Agriculture (PGRFA) facilitates the assignment of a persistent unique identifier (PUID), in the form of a Digital Object Identifier (DOI) to the Global Information System (GLIS) users, free of charge (<https://ssl.fao.org/glis>). The Secretariat is also available to provide training and support required by stakeholders for the adoption of DOIs.

DOIs go beyond the concatenation of fields and offer advanced services that would, for instance, facilitate the identification of germplasm safety duplicated in *ex situ* conditions (i.e. genebank or herbarium), or allow a flexible access to information associated to the CWR. Although different PUID technologies exist, DOIs have been selected as the best option by a panel of experts in 2015.

X. **Persistent Unique Identifier**

(PUID)

It is any persistent unique identifier assigned to the population so it can be unambiguously referenced at the global level and the information associated with it harvested through automated means. Report one PUID for each population. For *ex situ* material DOIs have been adopted since 2017.
